

SUBMISSION VIDEO GUIDE & DEMO SCRIPT

SENTINEL AI SURVEILLANCE PLATFORM

3 to 5 Minute Professional Video Recording Script

1. Step-by-Step Recording Script

Part 1: Introduction & The Problem Statement

0:00 – 0:45

Visual: Show Title Slide or Main Dashboard Overview.

"Hello and welcome to the demonstration of the Sentinel AI Surveillance Platform — an enterprise-grade, 100% self-hosted ANPR and GIS vehicle tracking system built for police command centers.

In real-world police operations, surveillance networks struggle with multi-vendor camera silos, tough Indian license plate variations, and delayed alerting. Sentinel AI solves this with a unified video ingestion gateway, sub-second AI ANPR inference, and real-time GIS breadcrumb tracking — with zero recurring cloud API costs."

Part 2: Multi-Camera Ingestion & Live Video Grid

0:45 – 1:30

Visual: Switch to Live Camera Grid tab. Show 4 live camera feeds with green status badges and vehicle bounding boxes.

"Here is our live surveillance matrix. The system connects to any RTSP or ONVIF stream — whether Hikvision, Dahua, CP Plus, or Axis — using our MediaMTX video proxy with ultra-low latency.

Our dual-head YOLOv8 model continuously isolates vehicles and localizes license plates, passing crops to our optimized PaddleOCR engine that handles 2-line plates, commercial yellow plates, and green EV plates with over 97% detection accuracy."

Part 3: Real-Time Hotlist Alert & Instant Siren

1:30 – 2:30

Visual: Trigger detection matching hotlist vehicle (GJ01AB1234). Show red flashing alert banner on sidebar with audio chime.

"Now watch what happens when a red-flagged vehicle passes a camera junction. Within less than 400 milliseconds from camera capture, our in-memory Redis hotlist engine identifies a critical match for FIR-2026-9081 (Stolen SUV).

The operator immediately receives a flashing visual alert and audio siren, complete with high-resolution

plate crops, timestamp, and location. With one click, the operator can acknowledge the alert or view the live camera feed to dispatch a PCR unit."

Part 4: GIS Map & Breadcrumb Journey Replay

2:30 – 3:45

Visual: Navigate to GIS Map / Trajectory Search tab. Enter plate GJ01AB1234 and show the numbered breadcrumb path (1 → 2 → 3 → 4) with speed estimations.

"For post-incident forensics and live pursuit, our GIS module reconstructs the vehicle's exact journey on an interactive map using PostGIS spatial geometry.

Notice how the system chronologically connects every camera sighting with directional arrows, calculating average speeds and transit time between junctions. Investigators can instantly understand the fleeing suspect's direction of escape."

Part 5: Architecture, Compliance & Conclusion

3:45 – 4:30

Visual: Show Architecture Diagram or Camera Manager page.

"Under the hood, Sentinel AI runs a FastAPI async backend, PyTorch AI pipeline, and PostGIS database. The entire stack is 100% self-hosted, air-gapped network compatible, and adheres to State Data Centre security standards with zero third-party cloud dependencies.

Thank you for reviewing the Sentinel AI Surveillance Platform."

2. Test Records Checklist

Plate Number	Vehicle Details	Category	FIR Reference	Severity
GJ01AB1234	White Fortuner (SUV)	Stolen Vehicle	FIR-2026-9081 (Vastrapur PS)	CRITICAL
GJ05CD5678	Black Swift (Hatchback)	Wanted Suspect	FIR-2026-4412 (Surat PS)	HIGH
